Learning Objectives

1. Name several general characteristics of storage systems.
2. Describe the two most common types of hard drives and what they are used for today.
3. Discuss the various types of optical discs available today and how they differ from each other.
4. Identify some flash memory storage devices and media and explain how they are used today.
5. List at least three other types of storage systems.
6. Summarize the storage alternatives for a typical personal computer.
This chapter covers:

– The characteristics common among all storage systems
– The primary storage for most personal computers—the hard drive
– How optical discs work and the various types that are available today
– Flash memory storage systems
– Network and cloud storage, smart cards, holographic storage, and storage systems used with large computer systems
– Storage alternatives for a typical personal computer
Storage System Characteristics

• Storage Media and Storage Devices
  – Medium
    • Hardware where data is stored
    • DVD disc, flash memory card, etc.
  – Device
    • DVD drive, flash memory card reader, etc.
    • Medium is inserted into device to be used
  – Can be internal, external, or remote
  – Storage devices are typically identified by letter
Storage System Characteristics

The letter C is usually assigned to the first hard drive.

CD/DVD drives are usually assigned letters after the hard drives, such as D in this example.

Any storage devices attached to the computer via USB ports are typically assigned next, such as E for this USB flash drive.

Other letters, beginning with F in this example, are used for any other storage devices attached to the computer, such as via this built-in flash memory card reader.

FIGURE 3-1
Storage device identifiers. To keep track of storage devices in an unambiguous way, the computer system assigns letters of the alphabet or names to each of them.
Storage System Characteristics

• Volatility
  – Storage media are nonvolatile

• Random vs. Sequential Access
  – Random access (direct access) allows data to be retrieved from any location on the storage medium
  – Virtually all storage devices use random access
  – Sequential access means retrieval of data can occur only in the order in which it was physically stored on the storage medium

• Magnetic tape drive
Storage System Characteristics

• Logical vs. Physical Representation
  – File
    • Anything stored on a storage medium, such as a program, document, digital image, or song
  – Filename
    • Name given to a file by the user
  – Folder
    • Named place on a storage medium into which files can be stored
Storage System Characteristics

FIGURE 3-2
Organizing data.
Folders are used to organize related items on a storage medium.
Storage System Characteristics

– Logical file representation
  • Individuals view a document stored as one complete unit in a particular folder on a particular drive

– Physical file representation
  • Computers access a particular document stored on a storage medium using its physical location or locations

• Types of Storage Technology Used
  • Magnetic (conventional hard drives)
  • Optical (optical discs)
  • Electrons (flash memory media)
Hard Drives

• Hard Drive
  – Used to store most programs and data
  – Can be internal or external
  – Can be encrypted

• Magnetic Hard Drives
  – One or more permanently sealed metal magnetic disks with an access mechanism and read/write heads

Understanding Computers: Today and Tomorrow, 15th Edition
Hard Drives

**FIGURE 3-5**
Magnetic hard drives.
Hard Drives

- Hard disks are divided into:
  - Tracks
    - Concentric path on disk where data is recorded
  - Sectors
    - A small piece of the track
  - Clusters
    - One or more sectors; smallest addressable area of a disk
  - Cylinders
    - Collection of tracks located in the same location on a set of hard disk surfaces
Hard Drives

FIGURE 3-6
Magnetic hard disks are organized into sectors, tracks, clusters, and cylinders.
How It Works Box

More Storage for Your Tablet

– Media tablets often have 64 GB of storage
– To extend storage, can transfer content to and from PCs
– Easier is to use a wireless hard drive
– Need the appropriate app
Hard Drives

• Solid State Drives (SSDs)
  – Use flash memory technology
  – Use less power and have no moving parts
  – Particularly appropriate for portable computers and mobile devices

FIGURE 3-7
Solid-state drives (SSDs).
Inside the Industry Box

Data Recovery Experts

– Can recover data from damaged storage devices
– Can be used when devices are physically damaged or just stop working
– Back up to prevent data loss

Data recovery. The data on this destroyed computer (left) was recovered by data recovery experts in a clean room (right).
Internal and External Hard Drives

• Internal hard drives
  – Permanent storage devices located inside the system unit
  – Removed only if a problem develops

• External hard drives
  – Commonly used to transport large amounts of data from one computer to another
  – Portable external hard drives are smaller and easier to transport
  – Most connect with a USB connection although some may be wireless
**Internal and External Hard Drives**

**FULL-SIZED EXTERNAL HARD DRIVES**
Are about the size of a 5 by 7-inch picture frame, but thicker; this drive contains two magnetic hard drives, which hold 6 TB total.

**PORTABLE HARD DRIVES (MAGNETIC)**
Are about the size of a 3 by 5-inch index card, but thicker; this drive holds 2 TB.

**PORTABLE HARD DRIVES (SSD)**
Are about the size of a credit card, but thicker; this drive holds 256 GB.

*FIGURE 3-8*
External hard drives.
Hard Drive Speed, Disk Caching, and Hybrid Hard Drives

• Disk access time
  – Total time that it takes for a hard drive to read or write data
  – Consists of seek time, rotational delay, and data movement time
  – SSDs don’t require seek time or rotational delays

• Disk cache
  – Memory used in conjunction with a magnetic hard drive to improve system performance
  – Typically consist of memory chips on a circuit board inside the hard drive case
Hybrid Hard Drive

- Combination of flash memory and magnetic hard drive
- Uses flash memory for cache
- Allows encryption to be built into the drive
Hard Drive Partitioning and File Systems

• Partitioning
  – Divides the physical capacity of a single drive logically into separate areas, called partitions
  – Partitions function as independent hard drives
  – Referred to as logical drives
  – Increases efficiency (smaller drives use smaller clusters)

• Partitions used to create:
  – A recovery partition
  – A new logical drive for data
  – A dual boot system
Hard Drive Partitioning and File Systems

- File system
  - Determines the partition size, cluster size, maximum drive size, and maximum file size
- FAT, FAT32, and NTFS

*FIGURE 3-10* Hard drive partitions. New personal computers today often come with the primary hard drive divided into two partitions.
• Determine how a drive connects to the computer
• Common standards
  – Parallel ATA (PATA) - older, slower standard
  – Serial ATA (SATA)
  – eSATA
  – SCSI and the newer serial attached SCSI (SAS)
  – Fibre Channel
  – Fibre Channel over Ethernet (FCoE)
  – Internet SCSI (iSCSI)
Quick Quiz

1. Of the following three options, the storage media that would likely hold the most data is a(n) __________.
   a. internal hard drive
   b. USB flash memory drive
   c. portable hard drive

2. True or False: Hard drives typically contain more than one metal hard disk.

3. The circular rings on a magnetic disk on which data is stored are called __________.

Answers:
1) a; 2) True; 3) tracks
Optical Discs and Drives

• Optical Disc Characteristics
  – A type of storage read from and written to using laser beams
  – Today’s standard for software delivery
  – Divided into sectors like magnetic discs but use a single spiral track (groove)
  – Have a relatively large capacity and are durable
  – Used for backup purposes and for storing and transporting music, photos, video, etc.
Optical Discs and Drives

• Representing Data on an Optical Disc
  – Read-only optical disc
    • Surface of disc is molded or stamped
  – Recordable or rewritable disc
    • Optical drive is used and the reflectivity of the disc is changed using a laser to represent the data
    – Pits and lands are used to represent 1s and 0s
    – The transition between a pit and a land represents a 1; no transition represents a 0
Optical Discs and Drives

**Figure 3-11**
How recorded optical discs work.

- **Track**: A single track spirals from the center of the disc outward; recorded data is stored on the track.

- **Sectors**: The track is divided into sectors for data organization.

- **Writing Data**: When data is written to the disc, a laser beam creates pits, represented by dark, nonreflective areas on the disc.

- **Reading Data**: A low intensity laser beam reads the disc. A transition between a pit and a land is interpreted as a 1; a set period of time between transitions is interpreted as a 0.
Optical Discs and Drives

- Optical Drives
  - Three categories of discs: CD, DVD, or Blu-Ray Disc (BD)
  - Can be read-only, recordable, or rewritable
  - Almost always downward compatible
  - Can support single or dual layer discs
  - Recording data onto disc is called burning
  - Can be internal or external drives
    - External drives typically connect via USB port
Optical Discs and Drives

• Optical Disc Shapes, Sizes, and Capacities
  – Standard size is 120-mm (about 4.7 inches)
    • Mini discs are smaller—80-mm
  – Theoretically can be made into various shapes—hearts, triangles, irregular shapes, or a hockey-rink shape
    • Patent battle exists about changing optical disc shapes
    • None of these different shapes are currently available
Optical Discs and Drives

• Major advantage: large capacity
  – CD discs are normally single layer and hold 650 or 700 MB
  – DVD discs hold 4.7 GB (single-layer) or 8.5 GB (dual-layer)
  – BD discs hold 25 GB (single-layer) or 50 GB (dual-layer)
  – Discs can also be double-sided
  – Researchers continually work to increase the capacity of optical discs
    • DL and XL discs
    • 4K (Ultra HD) Blu-ray Discs
Optical Discs and Drives

**FIGURE 3-14**
Summary of optical discs.
Read-Only Optical Discs

- CD ROM, DVD ROM, and BD-ROM
  - Can be read from, but not written to, by the user
    - CD-ROM (compact disc read-only memory)
    - DVD-ROM (digital versatile disc read-only memory)
    - BD-ROM (Blu-Ray Disc read-only memory)
  - Normally come pre-recorded
    - Software programs
    - Clip art and other graphics
    - Music
    - Movies
    - Games (PlayStation, Wii, Xbox, etc.)
Recordable Optical Discs

  - Can be written to, but cannot be erased and reused
  - No physically molded pits
  - Most have a recording layer containing organic light-sensitive dye between disc’s plastic and reflective layers
    - Except the BD-R disc, which has inorganic material
  - Used for backing up files, sending large files to others, and creating custom music CDs
Rewritable Optical Discs

• CD-RW, DVD-RW, DVD+RW, and BD-RE Discs
  – Can be written to, but cannot be erased and reused
  • Uses phase change technology
    – Heating and cooling process is used to change the reflectivity of the disc
  • Capacities are identical to the read-only and recordable discs, except BDXL
    – Appropriate for transferring large files from one computer to another or temporarily storing TV shows
Quick Quiz

1. The capacity of the typical CD disc is __________.
   a. 50 GB
   b. 700 MB
   c. 4.7 GB

2. True or False: A DVD-RW disc can be written to and rewritten to.

3. The tiny depressions, dark areas, or otherwise altered spots on an optical disc that are used to represent data are called __________.

Answers:
1) b; 2) True; 3) pits
DNA Data Storage

– Possible data storage medium
  • Long-term, high-density encoding
– Researchers have encoded data in DNA
  • Translated into binary 0s and 1s, then to a ternary code, and then as strings of DNA’s chemical bases and stored in DNA
– Biggest obstacle is cost - $12,400/MB
– Biggest possibility: archiving
Flash Memory Storage Systems

• **Flash Memory**
  – Chip-based storage medium that represents data using electrons
  – Used in SSDs and hybrid hard drives

• **Embedded Flash Memory**
  – Flash memory chips embedded into products, such as
    • Portable digital media players, digital cameras
    • Handheld gaming devices, GPS devices, mobile phones
    • Sunglasses and wristwatches
Flash Memory Storage Systems

FIGURE 3-16
Embedded flash memory.

MEDIA TABLET
Contains 64 GB of embedded flash

EMBEDDED FLASH MEMORY

Courtesy of SanDisk Corporation
Flash Memory Storage Systems

• Flash Memory Cards and Readers
  – Flash memory card
    • Small card containing one or more flash memory chips, a controller chip, and metal contacts to connect the card to the device or reader with which it is being used
  • Available in various formats that are not interchangeable:

<table>
<thead>
<tr>
<th>Format</th>
<th>Secure Digital (SD)</th>
<th>xD Picture Card</th>
</tr>
</thead>
<tbody>

Flash Memory Storage Systems

FIGURE 3-17
Some flash memory cards, readers, and adapters.
Flash Memory Storage Systems

• General-purpose flash memory card
  – Appropriate for most applications

• Specialized flash memory cards
  – Professional flash memory cards
    • Designed for professional photographers
  – Gaming flash memory cards
    • Designed for gaming consoles
  – HD flash memory cards
    • Designed for capturing and transferring high-definition video
Flash Memory Storage Systems

• USB Flash Drives
  – Sometimes called flash memory drives, jump drives, or thumb drives
  – Flash memory media integrated into a self-contained unit that plug into and is powered by a USB port
  – Designed to be very small and very portable
  – Available in a host of formats including custom shapes
  – Can be built into a consumer product
  – Can be used to lock a computer and to issue Web site passwords
  – Can include biometric features, such as a built-in fingerprint reader
Flash Drive Storage Systems

CONVENTIONAL DRIVE

CUSTOM LANYARD DRIVE

CUSTOM WALLET DRIVE

FIGURE 3-18
USB flash drives.
Thumb Drive PCs

- Portable apps turn USB flash drives and other small devices into personal computers
- Download app and desired software to the USB flash drive
- To use, plug into a computer
Other Types of Storage Systems

• Network Storage and Cloud Storage Systems
  – Remote storage
    • Using a storage device not directly connected to the computer being used
    • Accessed through the Internet or through a network
  – Network storage
    • Remote storage via local network
Network and Cloud Storage Systems

• Network attached storage (NAS)
  – High performance storage systems connected individually to a network
  – Designed for small business and home use

• Storage area network (SAN)
  – Separate network of hard drives or other storage devices which are attached to the main network
Network and Cloud Storage Systems

Devices on this network.

Items in the Public folder on the computer called DENNIS-NOTEBOOK.

**FIGURE 3-19**
Network storage.

**NETWORK ATTACHED STORAGE (NAS) DEVICES**
This NAS device holds up to 16 TB of data and provides storage for all computers on the network.
Network and Cloud Storage Systems

- Cloud storage (online storage)
  - Accessed via the Internet
    - Via Web sites (Flickr, Facebook, Google Docs, etc.)
    - Via online storage sites (Box, Dropbox, etc.)
  - Growing in importance because more and more applications are Web based
  - Increasing being used for backup purposes
  - Files can be synched between PC and cloud storage
  - Many Web sites providing online storage offer it free
  - Business cloud storage is available
Network and Cloud Storage Systems

**FIGURE 3-20**
Cloud storage. This site provides 7 GB of free storage.

FOLDERS AND FILES
Folders can be private or shared with designated individuals.

LOGGING ON
Users log on to see their personal files stored on the site's server.

SYNCING FILES
Many cloud storage services have a desktop app/sync option, which creates a cloud folder on your device once you download the app—you can just drag items into that folder to upload them to your cloud account.
Smart Cards

- Smart Card
  - Credit card-sized piece of plastic that contains some computer circuitry (processor, memory, and storage)
  - Stores small amount of data (about 64 KB or less)
  - Commonly used to store prepaid amounts of digital cash or personal information
  - Smart card readers are built into or attached to a computer, door lock, vending machine, or other device
  - Some smart cards store biometric data
  - Use of mobile smart cards is an emerging trend
Smart Cards

**LOGGING ONTO A COMPUTER VIA A CONTACT SMART CARD READER**

**MAKING A VENDING MACHINE PURCHASE VIA A CONTACT SMART CARD READER**

**ACCESSING A SECURE FACILITY VIA A CONTACTLESS SMART CARD READER**

**PURCHASING SUBWAY ACCESS VIA A CONTACTLESS SMART CARD READER**

*FIGURE 3-21*
Common smart card applications.
Holographic Storage

• Holographic storage
  – Holographic drives connect to a computer via a serial attached SCSI (SAS) or Fibre Channel interface
  – Uses multiple blue laser beams to store data in three dimensions
    • Reference beam and signal beam
  – Suited to applications in which large amounts of data need to be stored or retrieved quickly but rarely changed
    • Archiving business data, medical records, TV shows, sensor data, etc.
Holographic Storage

1. A laser beam is used to write or read data.

2. The beam is split into two beams (a reference beam and a signal beam) here, which intersect again at the storage medium.

3. Data is converted into a hologram, which is stored where the beams intersect in the storage medium.

4. When data needs to be read, it is projected onto a detector to be reconstructed.

FIGURE 3-22
Holographic storage. Holographic drives store more than one million bits of data in a single flash of light.
Storage Systems for Large Computer Systems

• Business storage needs are growing exponentially
  – Digital data produced is expected to double every two years through 2020

• Storage server
  – Hardware device containing multiple high-speed hard drives connected to the computer system or network
  – Most are based on magnetic hard discs
Storage Systems for Large Computer Systems

HARD DRIVES
Are located inside a drive enclosure; this enclosure can hold up to 24 drives of varying capacities—up to 3 TB each.

STORAGE SYSTEM
This system can manage up to 240 hard drives for a total maximum capacity of 432 TB.

FIGURE 3-23
Large storage systems are usually scalable so additional hard drives can be added as needed.
Storage Systems for Large Computer Systems

• RAID (redundant arrays of independent discs)
  – Method of storing data on two or more hard drives that work together to do the job of a larger drive
  – Mostly used to protect critical data on large storage systems
  – Usually involves recording redundant copies of stored data
  – Helps to increase fault tolerance
Storage Systems for Large Computer Systems

• Different levels of RAID:
  – RAID 0 = disk striping (spread files over two or more hard drives)
  – RAID 1 = disk mirroring (duplicate copy)
  – Other level use a combination or striping and mirroring

• Drobo system
  – New RAID storage system
  – Much easier to use than previous systems
  – Offers continuous data redundancy
Storage Systems for Large Computer Systems

**FIGURE 3-24**
RAID. Two primary RAID techniques are striping and mirroring.

**STRIPING**
When a file is written to a RAID system using striping, it is split among two or more drives.

**MIRRORING**
When a file is written to a RAID system using mirroring, an identical copy of the file is sent to another drive in the system.
Magnetic Tape Systems

- Magnetic Tape
  - Plastic tape coated with a magnetizable substance that represents the bits and bytes of digital data
  - Primarily used for backup and archival purposes
  - Sequential access only
  - Low cost per terabyte
  - Most tapes today are in the form of cartridge tapes
Evaluating Your Storage Alternatives

• Product Characteristics to Consider:
  – Speed
  – Compatibility
  – Storage capacity
  – Convenience
  – Portability

• Most Users Require:
  – Hard drive
  – Recordable or rewritable optical drive
  – Flash memory card reader
  – USB ports
Quick Quiz

1. An online photo sharing site is an example of __________.
   a. RAID
   b. cloud storage
   c. holographic storage

2. True or False: Flash memory storage systems are called solid-state storage systems because they are nonvolatile.

3. A type of sequential storage that sometimes used today for backup purposes is __________.

Answers:
1) b; 2) False; 3) magnetic tape
